

Website Exercise (Lolo)

Create a website “Lolo” that fetches the source content from:

<https://flipboard.com/@raimoseero/feed-nii8kd0sz.rss>

The full content should be shown on the created web page.

Example layout on larger display (desktop computer)

Example layout on mobile device

- Every article can be opened by clicking on the article title, description or image.
- Before displaying the article, it must be freed from clutter using Mercury API web parser: <https://mercury.postlight.com/web-parser/>
- Clutter free article content should be displayed in scalable modal / pop-up window.
- No other external APIs or web services can be used.
- Scalable CSS should be added by developer and not by referencing well known front-end component libraries like “Bootstrap” or similar.
- Finished website host on Heroku cloud platform: <https://www.heroku.com/>

Finally, send us link to your hosted site (Heroku) and source code.
